FUEL PUMP MODULES

USMW Professional Series fuel pump modules are manufactured with quality components

- POM plastic used for strength and durability
- Thicker connector pins for increased reliability
- Teflon insulated wires for superior chemical resistance
- Nitrile or Viton used for rubber components for long life and fuel resistance
- Stainless steel used for all metal components
- Foam fuel float for increased reliability over molded type
- Dual strainers for superior filtration. Mounted internally and externally

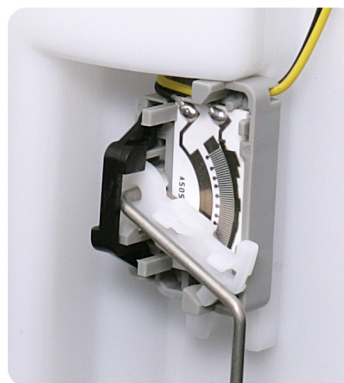

OE Style internal fuel pumps

USMW uses OE style fuel pumps rather than less expensive turbine units (where applicable). This ensures quality and performance that meets or exceeds OE standards.

Palladium Silver fuel level sensor

The Palladium Silver is resistant to corrosion from Ethanol and Ethanol blended fuels.

Level sensors also feature bifurcated contacts for long life and accurate fuel reading.

More fuel delivery...

USMW Professional Series also offers a complete line of Universal fuel pumps. Designed to handle low and high pressure applications and all modern fuel types
